OmniROTA uses bus and crew schedules created in OmniBASE to produce accurate and efficient rotas in a fraction of the time taken when produced manually.

Using OmniROTA, clients can create multiple rotas, with full on-screen editing and full checking to produce balanced rotas to desired parameters. Typical checks include double cover, minimum break periods and duties without cover.

To aid the preparation of meaningful rotas, OmniROTA can be edited to fit with clients' unique requirements, including rest days and duty length, highlighting under valued weeks and enabling the user to balance these against higher values.

After rotas have been created, clients can create full rota reports and print rosters in a number of styles, including a rota key for quick and simple tracking of duties covered.

OmniDRIVER, the OmniROTA Driver Module, allows planned weekly rotas to be prepared and maintained. This addition to OmniROTA clearly shows drivers allocated, uncovered work and daily exceptions, and a range of reports is available, including Planned Rota and Daily Sign-On Sheets.
